SOFE 4640U: Mobile Application Development

Assignment 2

Ashad Ahmed

100745913

Overview:

The task for assignment 2 was to create a Location Finder app that demonstrates users understanding of implementing databases in Java with Android studio. The tasks were to create a database (which was done using SQLite) that contained an ID, an address, the latitude and the longitudinal coordinates of a location and perform search queries as well as add, delete and update operations to this database in the app.

Snapshots and Explanation:

Here are the snapshots for all 4 addresses and the values used for each one. The add button adds a new field, the delete button removes it, the update button changes the values of a certain address when pressed, and the search button pulls up the address when any singular field is filled out.
